

U.S. Serial No.: 10/659,488

2

October 26, 2004

Second Amendment Under 37 CFR § 1.116—Claims

1. (currently amended) A high-density electrical connector comprising:
 - a rigid member having an array of electrical contact pads arranged in at least three rows with several electrical contact pads in each row,
 - a clamp housing attached to the rigid member,
 - a flexible printed circuit having a back surface, a front surface and a contact portion having an array of electrical contacts protruding outwardly of the front surface of the flexible printed circuit,
 - the contact portion being disposed between the clamp housing and the rigid member,
 - the array of protruding electrical contacts matching the array of electrical contact pads, and
 - an elastomer contact pressure pad disposed between the clamp housing and the flexible printed circuit pressing each of the electrical contacts into one of the electrical contact pads,
 - the elastomeric pad having an arcuate surface on one side engaging the back surface of the flexible printed circuit and ~~a plurality of at least three longitudinal ribs~~ on an opposite side engaging the clamp housing, and
 - the flexible printed circuit having a greater number of longitudinal rows of contacts than the number of longitudinal ribs.
2. (original) The electrical connector as defined in claim 1 wherein the array of electrical contacts is an array of bump contacts.
3. (original) The electrical connector as defined in claim 1 wherein the array of electrical contacts is an array of gold dot contacts.

U.S. Serial No.: 10/659,488

4. (currently amended) A high-density electrical connector comprising:
a rigid member having an elongate array of electrical contact pads
arranged in several rows with several electrical contact pads in each row,
an adjustable clamp housing attached to the rigid member,
a flexible printed circuit including a flexible ribbon insulator having a
back surface and a front surface,
the flexible printed circuit including a contact portion having an
elongate array of electrical contacts that protrude outwardly of the front surface of the
flexible ribbon insulator,
the contact portion being disposed between the clamp housing and the
rigid member,
the elongate array of electrical contacts matching the elongate array of
electrical contact pads, and
an elongate elastomeric contact pressure pad disposed between the
clamp housing and the contact portion of the flexible printed circuit pressing each of
the electrical contacts into one of the electrical contact pads,
the elongate elastomeric pad having an arcuate surface on one side
engaging the back surface of the flexible insulator ribbon of the flexible printed
circuit and a plurality of at least three longitudinal ribs on an opposite side engaging
the clamp housing,
the flexible printed circuit having a number of longitudinal rows of
contacts greater than the number of longitudinal ribs.

5. (original) The high density electrical connector as defined in
claim 4 wherein the elastomeric pad is resiliently deformed by the clamp housing to
provide a substantially uniform contact pressure to the elongate array of electrical
contacts.

6. (original) The high density electrical connector as defined in
claim 4 wherein the elongate array of electrical contact pads and the elongate array of
electrical contacts are rank and file arrangements comprising a plurality of
longitudinal rows of contacts each comprising a short lateral row of contacts.

U.S. Serial No.: 10/659,488

7. (currently amended) A high-density electrical connector comprising:
a rigid member having an elongate rank and file array of electrical
contact pads arranged in several rows with several electrical contact pads in each row,
an adjustable clamp housing attached to the rigid member,
a flexible printed circuit including a flexible ribbon insulator having a
back surface and a front surface,
the flexible printed circuit including a contact portion having an
elongate rank and file array of electrical contacts that protrude outwardly of the front
surface of the flexible ribbon insulator,
the contact portion being disposed between the clamp housing and the
rigid member,
the elongate array of electrical contacts matching the elongate array of
electrical contact pads, and
an elongate elastomeric contact pressure pad disposed between the
clamp housing and the contact portion of the flexible printed circuit pressing each of
the electrical contacts into one of the electrical contact pads,
the elongate elastomeric pad having an arcuate surface on one side
engaging the back surface of the flexible insulator ribbon of the flexible printed
circuit, and a plurality of at least three longitudinal ribs on an opposite side engaging
the clamp housing,
the longitudinal ribs being substantially parallel and the arcuate side
having an apex that is substantially parallel to the longitudinal ribs, and
the flexible printed circuit having a number of longitudinal rows of contacts
greater than the number of longitudinal ribs.

8. (original) The high density electrical connector of claim 7 wherein
the elastomeric pad is resiliently deformed by the clamp housing to provide a
substantially uniform contact pressure to the elongate array of electrical contacts.

9. (original) The high density electrical connector of claim 8 wherein
the arcuate surface is flattened and the longitudinal ribs are flattened whereby the one
side and the other side are substantially planar and parallel to each other.

U.S. Serial No.: 10/659,488

October 26, 2004

10. (cancelled) The high density electrical connector of claim 8 wherein the clamp housing has narrow locator ribs for the elastomeric pad and the longitudinal ribs of the elastomeric pad are located inside the narrow locator ribs.

11. (cancelled) The high density electrical connector of claim 8 wherein the flexible printed circuit has a number of longitudinal rows of contacts and the elastomeric pad has a lesser number of longitudinal ribs.
